

AMENDMENTS TO THE CLAIMS:

This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims:

1-55. (Canceled)

56. (Currently Amended) A wall system, comprising:

at least a first perimeter framing member configured to hold at least a first wall panel;

at least a second perimeter framing member configured to hold at least a second wall

5 panel, wherein the first and second perimeter framing members engage one another, wherein
at least one of the first and second perimeter framing members defines a recess extending
inwardly relative to exterior surfaces of the first and second wall panels, wherein at least one
of the first and second perimeter framing members comprises a plurality of drainage holes,
wherein the plurality of drainage holes are in fluid communication with a gutter located in
10 an interior region behind the first and second panels and the first and second perimeter
framing members, and wherein the gutter collects and provides to the drainage holes
moisture located in the interior region for discharge into an exterior environment located
exteriorly of the first and second perimeter framing members and first and second wall
panels; and

15 a capillary break positioned on at least one of the first and second perimeter framing
members, wherein the capillary break is spaced from the plurality of drainage holes and
located interiorly of the drainage holes and, along with surfaces of the recess, defines a
circulating chamber located interiorly of the capillary break, whereby entry of terrestrial
fluids into at least one of the plurality of drainage holes is impeded, wherein a free end of the
20 capillary break is separated from one of the first and second perimeter framing members by
a gap through which terrestrial fluids pass to enter the circulating chamber, wherein a lower
surface of the circulating chamber is contoured to permit terrestrial fluids collected in the
circulating chamber in the form of a liquid to flow as a liquid through the gap along the
lower surface for discharge into the exterior environment, wherein the plurality of drainage

25 holes are located above the free end of the capillary break, and wherein the capillary break extends downwardly from the at least one of the first and second perimeter framing members.

57. (Previously Presented) The wall system of Claim 56, wherein the recess has a downwardly sloped lower surface to permit terrestrial fluids in the circulating chamber to flow along the lower surface, and into the exterior environment and wherein an adjacent edge of a nearest drainage hole is at least about 0.75 inches from a rear surface of the capillary break.

58. (Previously Presented) The wall system of Claim 56, wherein a first space between a free end of the capillary break and an opposing wall of the recess has a first vertical cross-sectional area and a second space between opposing walls of the recess at a point between the capillary break and the plurality of drainage holes has a second vertical cross-sectional area and the second vertical cross sectional area is at least about 150% of the first vertical cross sectional area.

59. (Previously Presented) The wall system of Claim 56, wherein, at any location along the capillary break, an adjacent edge of a nearest drainage hole is at least about 0.25 inches from a rear surface of the capillary break.

60. (Previously Presented) The wall system of Claim 56, wherein the centers of the plurality of drainage holes lie along a common axis and wherein a distance of the drainage holes above a free end of the capillary break is at least about 125% of a distance from the free end of the capillary break to an adjacent, opposing surface of the recess.

61. (Previously Presented) The wall system of Claim 56, wherein a surface of the capillary break adjacent to the plurality of drainage holes is concave and wherein the first and second wall panels each is a composite of metal and plastic.

62. (Previously Presented) The wall system of Claim 56, wherein the plurality of drainage holes are spaced at regular intervals along the at least one of the first and second perimeter framing members, wherein a height of the capillary break ranges from about 125 to about 200% of a distance between a free end of the capillary break and an adjacent, opposing surface of the recess.

63. (Previously Presented) The wall system of Claim 56, wherein the plurality of drainage holes are located on one of the first and second perimeter framing members and the capillary break is located on the other of one of the first and second perimeter framing members.

64. (Previously Presented) The wall system of Claim 59, wherein the openings of the plurality of drainage holes are located on an at least substantially horizontal surface.

65. (Previously Presented) The wall system of Claim 57, wherein the plurality of drainage holes are located on the first perimeter framing member and the capillary break is located on the second perimeter framing member, wherein the openings of the plurality of drainage holes are located on an at least substantially vertical surface, and wherein the openings of the plurality of drainage holes are located above a free end of the capillary break.

66. (Previously Presented) The wall system of Claim 65, wherein the capillary break has a height and is separated by a gap from the first perimeter framing member and the height is at least about 100% of the width of the gap and wherein exterior surfaces of the first and second wall panels are at least substantially parallel and coplanar.

67. (Currently Amended) A wall system, comprising:

at least a first perimeter framing member configured to hold at least a first wall panel;

at least a second perimeter framing member configured to hold at least a second wall panel, wherein the first and second perimeter framing members engage one another, wherein

5 at least one of the first and second perimeter framing members defines a recess extending inwardly relative to exterior surfaces of the first and second wall panels, wherein at least one of the first and second perimeter framing members comprises a plurality of drainage holes, wherein the plurality of drainage holes are in fluid communication with an interior region and

10 discharge moisture located in the interior region into an exterior environment located exteriorly of the first and second perimeter framing members and first and second wall panels; and

a capillary break positioned on at least one of the first and second perimeter framing members, wherein the capillary break is spaced from the plurality of drainage holes and located between exterior surfaces of the first and second panels and the drainage holes,

15 whereby entry of terrestrial fluids into at least one of the plurality of drainage holes is impeded, wherein the capillary break and walls of the recess define a circulating chamber located in the recess, wherein the drainage holes and circulating chamber are interiorly of the

capillary break, wherein a free end of the capillary break is separated from one of the first and second perimeter framing members by a gap through which terrestrial fluids pass to enter

20 the circulating chamber, wherein a lower surface of the circulating chamber is contoured to permit terrestrial fluids collected in the circulating chamber in the form of a liquid to flow as a liquid along the lower surface and through the gap for discharge into the exterior environment, wherein the plurality of drainage holes are located above the free end of the

25 capillary break, and wherein the capillary break extends downwardly from the at least one of the first and second perimeter framing members.

68. (Previously Amended) The wall system of Claim 67, further comprising a gutter located in the interior region, wherein the gutter collects and provides to the drainage holes moisture located in the interior region for discharge into the exterior environment.

69. (Previously Presented) The wall system of Claim 67, wherein the recess has a sloped lower surface to permit terrestrial fluids in the circulating chamber to flow along the lower surface and into the exterior environment and wherein an adjacent edge of a nearest drainage hole is at least about 0.75 inches from the rear surface of the capillary break.

70. (Previously Presented) The wall system of Claim 67, wherein a first space between a free end of the capillary break and an opposing wall of the recess has a first vertical cross-sectional area and a second space between opposing walls of the recess at a point between the capillary break and the plurality of drainage holes has a second vertical cross-sectional area and the second vertical cross sectional area is at least about 150% of the first vertical cross sectional area.

71. (Previously Presented) The wall system of Claim 67, wherein, at any location along the capillary break, an adjacent edge of a nearest drainage hole is at least about 0.25 inches from a rear surface of the capillary break.

72. (Previously Presented) The wall system of Claim 67, wherein the centers of the plurality of drainage holes lie along a common axis and wherein a distance of the drainage holes above a free end of the capillary break is at least about 125% of a distance from the free end of the capillary break to an adjacent, opposing surface of the recess.

73. (Previously Presented) The wall system of Claim 67, wherein a surface of the capillary break adjacent to the plurality of drainage holes is concave and wherein the first and second wall panels each is a composite of metal and plastic.

74. (Previously Presented) The wall system of Claim 67, wherein the plurality of drainage holes are spaced at regular intervals along the at least one of the first and second perimeter framing members, wherein a height of the capillary break ranges from about 125 to about 200% of a distance between a free end of the capillary break and an adjacent, opposing surface of the recess.

75. (Previously Presented) The wall system of Claim 67, wherein the plurality of drainage holes are located on one of the first and second perimeter framing members and the capillary break is located on the other of one of the first and second perimeter framing members.

76. (Previously Presented) The wall system of Claim 71, wherein the openings of the plurality of drainage holes are located on an at least substantially horizontal surface.

77. (Previously Presented) The wall system of Claim 69, wherein the plurality of drainage holes are located on the first perimeter framing member and the capillary break is located on the second perimeter framing member, wherein the openings of the plurality of drainage holes are located on an at least substantially vertical surface, and wherein the openings of the plurality of drainage holes are located above a free end of the capillary break.

78. (Previously Presented) The wall system of Claim 77, wherein the capillary break has a height and is separated by a gap from the first perimeter framing member and the height is at least about 100% of the width of the gap and wherein exterior surfaces of the first and second wall panels are at least substantially parallel and coplanar.

79. (Currently Amended) A wall system, comprising:
at least a first perimeter framing member configured to hold opposing interior and exterior surfaces of at least a first wall panel;

at least a second perimeter framing member configured to hold opposing interior and exterior surfaces of at least a second wall panel, wherein the first and second perimeter framing members engage one another, wherein at least one of the first and second perimeter framing members defines a recess relative to exterior surfaces of the first and second wall panels, wherein at least one of the first and second perimeter framing members comprises a plurality of drainage holes, wherein the plurality of drainage holes are in fluid communication with a gutter located in an interior region behind the first and second panels and the first and second perimeter framing members, and wherein the gutter collects and provides to the drainage holes moisture located in the interior region for discharge into an exterior environment located exteriorly of the first and second perimeter framing members and first and second wall panels; and

capillary break means positioned on at least one of the first and second perimeter framing members for redirecting flow of terrestrial fluids, wherein the capillary break is located exteriorly of and spaced from the plurality of drainage holes and, along with surfaces of the recess, defines a circulating chamber operable to impede entry of terrestrial fluids into the interior region, the circulating chamber being located interiorly of the capillary break means, wherein a free end of the capillary break means is separated from one of the first and second perimeter framing members by a gap through which terrestrial fluids pass to enter the circulating chamber and wherein a lower surface of the circulating chamber is contoured to permit terrestrial fluids collected in the circulating chamber in the form of a liquid to flow, as a liquid, along the lower surface and through the gap for discharge into the exterior environment, wherein the plurality of drainage holes are located above the free end of the capillary break means, and wherein the capillary break means extends downwardly from the at least one of the first and second perimeter framing members.

80. (Previously Presented) The wall system of Claim 79, wherein the recess has an inclined lower surface to permit terrestrial fluids in the circulating chamber to flow along

the lower surface and into the exterior environment and wherein an adjacent edge of a nearest drainage hole is at least about 0.75 inches from the rear surface of the capillary break means.

5 81. (Previously Presented) The wall system of Claim 79, wherein a first space between a free end of the capillary break means and an opposing wall of the recess has a first vertical cross-sectional area and a second space between opposing walls of the recess at a point between the capillary break means and the plurality of drainage holes has a second vertical cross-sectional area and the second vertical cross sectional area is at least about 150% of the first vertical cross sectional area.

82. (Previously Presented) The wall system of Claim 79, wherein, at any location along the capillary break means, an adjacent edge of a nearest drainage hole is at least about 0.25 inches from a rear surface of the capillary break.

5 83. (Previously Presented) The wall system of Claim 79, wherein the centers of the plurality of drainage holes lie along a common axis and wherein a distance of the drainage holes above a free end of the capillary break means is at least about 125% of a distance from the free end of the capillary break means to an adjacent, opposing surface of the recess.

84. (Previously Presented) The wall system of Claim 79, wherein a surface of the capillary break means adjacent to the plurality of drainage holes is concave and wherein the first and second wall panels each is a composite of metal and plastic.

85. (Previously Presented) The wall system of Claim 79, wherein the plurality of drainage holes are spaced at regular intervals along the at least one of the first and second perimeter framing members, wherein a height of the capillary break means ranges from about

5 125 to about 200% of a distance between a free end of the capillary break means and an adjacent, opposing surface of the recess.

86. (Previously Presented) The wall system of Claim 79, wherein the plurality of drainage holes are located on one of the first and second perimeter framing members and the capillary break means is located on the other of one of the first and second perimeter framing members.

87. (Previously Presented) The wall system of Claim 82, wherein the openings of the plurality of drainage holes are located on an at least substantially horizontal surface.

5 88. (Previously Presented) The wall system of Claim 80, wherein the plurality of drainage holes are located on the first perimeter framing member and the capillary break means is located on the second perimeter framing member, wherein the openings of the plurality of drainage holes are located on an at least substantially vertical surface, and wherein the openings of the plurality of drainage holes are located above a free end of the capillary break means.

89. (Previously Presented) The wall system of Claim 88, wherein the capillary break means has a height and is separated by a gap from the first perimeter framing member and the height is at least about 100% of the width of the gap and wherein exterior surfaces of the first and second wall panels are at least substantially parallel and coplanar.

90-103. (Canceled)

104. (Previously Presented) The wall system of Claim 56, wherein the capillary break and drainage holes are located on a common side of the circulating chamber.

105. (Previously Presented) The wall system of Claim 67, wherein the lower surface of the circulating chamber is free of drainage holes.

106. (Previously Presented) The wall system of Claim 67, wherein at least most of the collected terrestrial fluids pass along the lower surface, through the gap, and into the terrestrial environment.

107. (Previously Presented) The wall system of Claim 106, wherein the at least most of the collected terrestrial fluids do not pass through a gutter during the passing step.

108. (Previously Presented) The wall system of Claim 67, wherein the capillary break and drainage holes are located on a common side of the circulating chamber.

109. (Previously Presented) The wall system of Claim 79, wherein the lower surface of the circulating chamber is free of drainage holes.

110. (Previously Presented) The wall system of Claim 79, wherein at least most of the collected terrestrial fluids pass along the lower surface, through the gap, and into the terrestrial environment.

111. (Previously Presented) The wall system of Claim 110, wherein the at least most of the collected terrestrial fluids do not pass through a gutter during the passing step.

112. (Previously Presented) The wall system of Claim 79, wherein the capillary break means and drainage holes are located on a common side of the circulating chamber.

113. (Previously Presented) A wall system, comprising:
at least a first perimeter framing member configured to hold at least a first wall panel;

at least a second perimeter framing member configured to hold at least a second wall panel, wherein the first and second perimeter framing members engage one another, wherein
5 at least one of the first and second perimeter framing members defines a recess extending inwardly relative to exterior surfaces of the first and second wall panels, wherein at least one of the first and second perimeter framing members comprises a plurality of drainage holes, wherein the plurality of drainage holes are in fluid communication with a gutter located in an interior region behind the first and second panels and the first and second perimeter
10 framing members, and wherein the gutter collects and provides to the drainage holes moisture located in the interior region for discharge into an exterior environment located exteriorly of the first and second perimeter framing members and first and second wall panels; and

a capillary break positioned on at least one of the first and second perimeter framing
15 members, wherein the capillary break is spaced from the plurality of drainage holes and, along with surfaces of the recess, defines a circulating chamber, whereby entry of terrestrial fluids into at least one of the plurality of drainage holes is impeded, wherein a free end of the capillary break is separated from one of the first and second perimeter framing members by a gap through which terrestrial fluids pass to enter the circulating chamber, wherein a lower
20 surface of the circulating chamber is contoured to permit terrestrial fluids collected in the circulating chamber to flow through the gap along the lower surface for discharge into the exterior environment, wherein the plurality of drainage holes are located above the free end of the capillary break, wherein the capillary break extends downwardly from the at least one of the first and second perimeter framing members, wherein the recess has a downwardly
25 sloped lower surface to permit terrestrial fluids in the circulating chamber to flow along the lower surface, and into the exterior environment, wherein an adjacent edge of a nearest drainage hole is at least about 0.75 inches from a rear surface of the capillary break, wherein the plurality of drainage holes are located on the first perimeter framing member and the capillary break is located on the second perimeter framing member, wherein the openings of
30 the plurality of drainage holes are located on an at least substantially vertical surface, and

wherein the openings of the plurality of drainage holes are located above a free end of the capillary break.

114. (Currently Amended) The wall system of Claim ~~H2~~113, wherein the capillary break has a height and is separated by a gap from the first perimeter framing member and the height is at least about 100% of the width of the gap and wherein exterior surfaces of the first and second wall panels are at least substantially parallel and coplanar.

115. (Currently Amended) A wall system, comprising:

at least a first perimeter framing member configured to hold at least a first wall panel;

at least a second perimeter framing member configured to hold at least a second wall panel, wherein the first and second perimeter framing members engage one another, wherein
5 at least one of the first and second perimeter framing members defines a recess extending inwardly relative to exterior surfaces of the first and second wall panels, wherein at least one of the first and second perimeter framing members comprises a plurality of drainage holes, wherein the plurality of drainage holes are in fluid communication with an interior region and discharge moisture located in the interior region into an exterior environment located
10 exteriorly of the first and second perimeter framing members and first and second wall panels; and

a capillary break positioned on at least one of the first and second perimeter framing members, wherein the capillary break is spaced from the plurality of drainage holes and located between exterior surfaces of the first and second panels and the drainage holes,
15 whereby entry of terrestrial fluids into at least one of the plurality of drainage holes is impeded, wherein the capillary break and walls of the recess define a circulating chamber located in the recess, wherein a free end of the capillary break is separated from one of the first and second perimeter framing members by a gap through which terrestrial fluids pass to enter the circulating chamber, wherein a lower surface of the circulating chamber is
20 contoured to permit terrestrial fluids collected in the circulating chamber to flow along the

lower surface and through the gap for discharge into the exterior environment, wherein the plurality of drainage holes are located above the free end of the capillary break, wherein the capillary break extends downwardly from the at least one of the first and second perimeter framing members, wherein the capillary break is positioned between an opening of the recess
25 on the one hand and the drainage holes and circulating chamber on the other hand, and wherein the plurality of drainage holes are located on one of the first and second perimeter framing members and the capillary break is located on the other of one of the first and second perimeter framing members.

116. (Previously Presented) A wall system, comprising:
at least a first perimeter framing member configured to hold at least a first wall panel;
at least a second perimeter framing member configured to hold at least a second wall panel, wherein the first and second perimeter framing members engage one another, wherein
5 at least one of the first and second perimeter framing members defines a recess extending inwardly relative to exterior surfaces of the first and second wall panels, wherein at least one of the first and second perimeter framing members comprises a plurality of drainage holes, wherein the plurality of drainage holes are in fluid communication with an interior region and discharge moisture located in the interior region into an exterior environment located
10 exteriorly of the first and second perimeter framing members and first and second wall panels; and

a capillary break positioned on at least one of the first and second perimeter framing members, wherein the capillary break is spaced from the plurality of drainage holes and located between exterior surfaces of the first and second panels and the drainage holes,
15 whereby entry of terrestrial fluids into at least one of the plurality of drainage holes is impeded, wherein the capillary break and walls of the recess define a circulating chamber located in the recess, wherein a free end of the capillary break is separated from one of the first and second perimeter framing members by a gap through which terrestrial fluids pass to enter the circulating chamber, wherein a lower surface of the circulating chamber is

20 contoured to permit terrestrial fluids collected in the circulating chamber to flow along the
lower surface and through the gap for discharge into the exterior environment, wherein the
plurality of drainage holes are located above the free end of the capillary break, wherein the
capillary break extends downwardly from the at least one of the first and second perimeter
framing members, wherein the recess has a sloped lower surface to permit terrestrial fluids
25 in the circulating chamber to flow along the lower surface and into the exterior environment
and wherein an adjacent edge of a nearest drainage hole is at least about 0.75 inches from the
rear surface of the capillary break, wherein the plurality of drainage holes are located on the
first perimeter framing member and the capillary break is located on the second perimeter
framing member, wherein the openings of the plurality of drainage holes are located on an
30 at least substantially vertical surface, and wherein the openings of the plurality of drainage
holes are located above a free end of the capillary break.

117. (Currently Amended) The wall system of Claim ~~115~~116, wherein the capillary
break has a height and is separated by a gap from the first perimeter framing member and the
height is at least about 100% of the width of the gap and wherein exterior surfaces of the first
and second wall panels are at least substantially parallel and coplanar.

118. (Currently Amended) A wall system, comprising:

at least a first perimeter framing member configured to hold opposing interior and
exterior surfaces of at least a first wall panel;

5 at least a second perimeter framing member configured to hold opposing interior and
exterior surfaces of at least a second wall panel, wherein the first and second perimeter
framing members engage one another, wherein at least one of the first and second perimeter
framing members defines a recess relative to exterior surfaces of the first and second wall
panels, wherein at least one of the first and second perimeter framing members comprises
a plurality of drainage holes, wherein the plurality of drainage holes are in fluid
10 communication with a gutter located in an interior region behind the first and second panels

and the first and second perimeter framing members, and wherein the gutter collects and provides to the drainage holes moisture located in the interior region for discharge into an exterior environment located exteriorly of the first and second perimeter framing members and first and second wall panels; and

15 capillary break means positioned on at least one of the first and second perimeter framing members for redirecting flow of terrestrial fluids, wherein the capillary break is spaced from the plurality of drainage holes and, along with surfaces of the recess, defines a circulating chamber operable to impede entry of terrestrial fluids into the interior region, wherein a free end of the capillary break means is separated from one of the first and second
20 perimeter framing members by a gap through which terrestrial fluids pass to enter the circulating chamber and wherein a lower surface of the circulating chamber is contoured to permit terrestrial fluids collected in the circulating chamber to flow along the lower surface and through the gap for discharge into the exterior environment, wherein the plurality of drainage holes are located above the free end of the capillary break means, wherein the
25 capillary break means extends downwardly from the at least one of the first and second perimeter framing members, wherein the capillary break is positioned between an opening of the recess on the one hand and the drainage holes and circulating chamber on the other hand, and wherein the plurality of drainage holes are located on one of the first and second perimeter framing members and the capillary break means is located on the other of one of
30 the first and second perimeter framing members.

119. (Previously Presented) A wall system, comprising:

at least a first perimeter framing member configured to hold opposing interior and exterior surfaces of at least a first wall panel;

at least a second perimeter framing member configured to hold opposing interior and
5 exterior surfaces of at least a second wall panel, wherein the first and second perimeter framing members engage one another, wherein at least one of the first and second perimeter framing members defines a recess relative to exterior surfaces of the first and second wall

panels, wherein at least one of the first and second perimeter framing members comprises a plurality of drainage holes, wherein the plurality of drainage holes are in fluid communication with a gutter located in an interior region behind the first and second panels and the first and second perimeter framing members, and wherein the gutter collects and provides to the drainage holes moisture located in the interior region for discharge into an exterior environment located exteriorly of the first and second perimeter framing members and first and second wall panels; and

capillary break means positioned on at least one of the first and second perimeter framing members for redirecting flow of terrestrial fluids, wherein the capillary break is spaced from the plurality of drainage holes and, along with surfaces of the recess, defines a circulating chamber operable to impede entry of terrestrial fluids into the interior region, wherein a free end of the capillary break means is separated from one of the first and second perimeter framing members by a gap through which terrestrial fluids pass to enter the circulating chamber and wherein a lower surface of the circulating chamber is contoured to permit terrestrial fluids collected in the circulating chamber to flow along the lower surface and through the gap for discharge into the exterior environment, wherein the plurality of drainage holes are located above the free end of the capillary break means, wherein the capillary break means extends downwardly from the at least one of the first and second perimeter framing members, wherein the recess has an inclined lower surface to permit terrestrial fluids in the circulating chamber to flow along the lower surface and into the exterior environment, wherein an adjacent edge of a nearest drainage hole is at least about 0.75 inches from the rear surface of the capillary break means, wherein the plurality of drainage holes are located on the first perimeter framing member and the capillary break means is located on the second perimeter framing member, wherein the openings of the plurality of drainage holes are located on an at least substantially vertical surface, and wherein the openings of the plurality of drainage holes are located above a free end of the capillary break means.

120. (Currently Amended) The wall system of Claim ~~118~~119, wherein the capillary break means has a height and is separated by a gap from the first perimeter framing member and the height is at least about 100% of the width of the gap and wherein exterior surfaces of the first and second wall panels are at least substantially parallel and coplanar.
